Consumer Watchdog California Recycling Study

Trashed: How California Recycling Failed And How To Fix It

EXECUTIVE SUMMARY

The California bottle deposit law was designed to recycle billions of empty glass, plastic and metal beverage containers every year, cut pollution, and save energy. Consumer Watchdog's year-long investigation of the system and others like it around the world has found that California's bottle deposit system will collapse without fundamental reform and that best practices are not being put to use here.

OVERVIEW OF PROBLEM

- Redemption centers are closing at an alarming rate and consumers are unable to get back roughly half of the \$1.5 billion worth of nickel and dime deposits they pay each year.
- Lack of access to redemption centers has increased CalRecycle's available funds, largely composed of unclaimed deposits, to approximately \$345 million.¹ Beverage distributors, retailers, and waste haulers further siphon off hundreds of millions of dollars that should go to consumers.
- High contamination of the waste stream by curbside waste haulers has foreign markets for our recycling materials shutting their doors.
- Supermarket chains and other beverage retailers legally obligated to be recyclers of last resort are refusing to redeem consumer deposits up to two-thirds of the time, according to three separate surveys.²
- The state's existing bottle law prevents retailers from effectively recycling redeemed bottles and cans. Instead of selling them in bulk to processors to recoup deposits refunded to consumers, they have to return them in limited quantities to certified recyclers.
- The state regulator, CalRecycle, has been ineffective, and, until very recently, has not policed or punished the retailers to make sure consumers can redeem their deposits.
- Waste haulers take in more than \$100 million worth of consumers' bottle and can deposits annually. California is the only state that allows haulers to redeem consumer deposits. The curb-side haulers are paid twice because other government entities already pay them.
- Unlike in other states and countries, the beverage industry has never been made to take responsibility for the end-of-life of the beverage containers they make,

distribute, and sell to the public. Instead, consumers shoulder the financial burden because they are unable to get their nickel and dime deposits back.

OVERVIEW OF SOLUTION

Last year, Governor Newsom, lawmakers and recycling stakeholders agreed that a major reform of the bottle deposit system is needed and should be undertaken in 2020.

Based on a review of successful bottle deposit systems in the U.S. and other countries, Consumer Watchdog recommends that California’s redemption system should be overhauled to:

1. Shift responsibility for recycling beverage containers away from consumers to the beverage industry.
2. Provide convenient, automated redemption at every supermarket, convenience, drug, and big box chain so returning empties is as easy as buying a beverage.
3. If necessary, raise consumer deposits on beverage containers to incentivize redemption once ubiquitous redemption access is established.
4. Expand the bottle deposit program to include wine and distilled spirits.
5. Phase in a state bottle deposit redemption target of 90%.
6. Use enforcement and financial penalties to ensure targets are met.

The best bottle deposit programs set deposits high enough to incentivize redemption, ensure wide access to convenient return of empties at retailers and redemption centers, and broadly educate consumers on their return options.

CHARACTERISTICS OF BOTTLE DEPOSIT PROGRAMS

Characteristic	Oregon	Michigan	Norway	Germany	Lithuania	CA
Redemption Rates	81%	89%	95%	98%	93%	*66%
Beverage Industry Responsible For Running Program	YES	YES	YES	YES	YES	NO
All Retailers Required To Redeem	YES	YES	YES	YES	YES	NO
Deposit Amount	10 CENTS	10 CENTS	UP TO 30 CENTS	UP TO 25 CENTS	13 CENTS	5 TO 10 CENTS
Curbside Haulers Collect Consumer Deposits	NO	NO	NO	NO	NO	YES

**The 66% redemption rate was calculated by the Container Recycling Institute based on CalRecycle data subtracting 12% of containers collected by curbside haulers and dropoff recycling programs and redeemed by them instead of by consumers.*

Key Findings

THE PROBLEM

California's bottle and can recycling program was once the envy of the world. Today it has become a failed model.

The recycling rate for empty plastic, glass, and aluminum beverage containers has fallen from 85% to 75%. The redemption rate is a mere 66%. Consumers only get back about 50% of their own nickels and dimes that totaled \$1.5 billion last year with surrogates collecting the rest of their deposits.³

The culprit is “single stream” recycling used by consumers as redemption centers in economic crisis close. One in four items thrown into single recycling bins are not recyclable or are contaminated with food or other waste.⁴ Pickup trucks smash and compact the contents, lacing loads with dirty glass shards and other contaminants. Industry analysts report that recycling facilities are routinely seeing contamination rates as high as 35%, condemning the material to landfills or incinerators.⁵

Successful recycling in the rest of the world is based on consumer convenience and returning cans to the point of purchase using modern automation such as Reverse Vending Machines. Consumers feed empties into the machines that sort them and get store credit or cash back. Models that work make beverage and retail companies that produce, deliver, and sell their products responsible for the recycling of their packaging. That incentivizes them to make the packaging more recyclable in the first place.

California has not learned that lesson, largely due to the political power of soda, beer and other beverage makers, distributors and retailers in Sacramento that want no added burdens. Many retailers that are statutorily obligated to redeem containers in-store refuse to do so. Their resistance is aided and abetted by waste haulers that rake in exorbitant government subsidies for increasingly contaminated loads. No other state uses funds from its bottle deposit program to make millions of dollars in “supplemental payments” to

operators of curbside and drop-off recycling programs just for being there. It is the only state that pays them for associated recycling costs plus allows them to collect consumer deposit money on top.

In 2017, haulers operating recycling programs wound up getting paid \$170 million by the state for container recycling plus earned another \$13 million for scrap. But they recycled only 12% of the containers in the program, according to analysis of CalRecycle data by the nonprofit Container Recycling Institute (CRI).⁶ Redemption centers, however, were paid only \$155 million for handling 88% of the containers.⁷ Waste haulers got paid ten percent more than redemption centers did overall for recycling a fraction of the empties.

Increased consolidation in the waste hauling business has put four garbage haulers in charge of at least 50% of the national market for waste hauling, and 75% of the permitted landfill capacity in major metropolitan areas, according to the Institute for Local Self-Reliance.⁸ They also now own 60% of the Material Recovery Facilities in the U.S. that extract and sell recyclable materials.⁹

Letting these companies control recycling is a conflict of interest. “The key takeaway is that a critical activity such as recycling in U.S. cities should not be entrusted to consolidated companies whose main business is landfilling and incinerating garbage,”

according to the Institute For Local Self-Reliance.¹⁰ “This is an obvious conflict of interest that has been the focus of attention in the grassroots recycling movement for quite a while.”

As *The New York Times* writes, “Some municipal leaders are growing wary of companies that control virtually every aspect of the waste and recycling system while constantly raising prices. ‘Are these rates truly high, or is it about benefiting their corporate interest?’ asked Mike Ryan, the mayor of Sunrise, Fla. ‘We can’t afford to have inspectors constantly looking over their shoulders.’”¹¹

SOLUTIONS

The Mercury News opined in an editorial, “It’s time to shift the cost and recycling burden. **The nine other states with redeemable deposit programs haven’t seen the same decline in recycling rates as California, according to a 2017 report from the state Legislative Analyst’s Office.¹² That’s in part because beverage distributors play a more significant role in those states and are responsible for most of the recycling cost.**”

Other states and countries place a shared responsibility for end-of-life product management on producers and all entities involved in the product chain, instead of onto the general public only. Known as “Extended Producer Responsibility,” or “EPR” programs, this policy encourages product design changes that minimize negative impacts on human health and the environment at every stage of the product’s lifecycle, according to CalRecycle, the state’s recycling regulator.

In fact, CalRecycle commissioned a study on how to restructure the deposit system a decade ago. The 2009 report, by the Sacramento-based R3 consulting group and CM Consulting of Ontario, Canada, compared bottle deposit programs in British Columbia, Ontario, and Germany to California’s.¹³ The report found such programs were driving successful beverage container packaging redesign, recycling and program innovation in Canada and Europe.

“There seems to be a consensus evolving in North America that good EPR programs are results-based rather than highly prescriptive,” the report stated. “In other words, the government’s role is to set performance standards in the public interest (with stakeholder input), and then step aside and let producers design and operate effective programs to recover their products. Then, government’s role is to ensure transparency and accountability for outcomes.”

As the R3 report pointed out, the three most important elements to successful bottle deposit programs are the amount of the deposit, consumer education, and wide access to

redemption. Higher redemption rates are directly linked to higher deposits and to consumer convenience. Yet, California's system is the most inconvenient out of more than 50 beverage container recycling programs around the world.

In California—unlike eight out of nine other states with bottle deposit programs—beverage retailers from grocery chains to big box, convenience and drugstore chains, are not required to take back empties alongside redemption centers.¹⁴ The 1986 California law obligated retailers to be recyclers of last resort if redemption centers failed to materialize or closed. Now that redemption centers are closing, the majority of retailers are refusing to fulfill those responsibilities.¹⁵

Returning empties right to the store where you do your shopping dramatically increases consumer convenience. Seven other states and the vast majority of other programs worldwide mandate redemption at *both* stores and redemption centers.

In the eighth state of Michigan, consumers have only one way to redeem—retail stores that sell beverages. Residents there redeem 89% of the beverage containers they buy, a high redemption rate spurred by higher deposits and ease of access to deposit refunds. Michigan also prohibits beverage containers from disposal in a landfill. Beverage containers must be placed in recycling bins, taken to a recycling center, or redeemed for deposit at a store—but are banned from trash cans.¹⁶

Oregon and Michigan also put responsibility onto the beverage industry to run the program. In Oregon, an industry consortium is responsible for running and financing the bottle redemption program and retains unclaimed deposits, while the system is overseen by the state. In Michigan, where the state also oversees the program, three quarters of unclaimed deposits fund state environmental programs and retailers and distributors cover operating costs and retain the rest.¹⁷

In California, unredeemed deposits go into a special state fund—the Beverage Container Recycling Fund. That larder has been raided and then replenished in the past to sop up budgetary red ink for other programs.¹⁸ Redemption centers are underpaid. Waste haulers that raise the contamination and landfilling rates of empty beverage containers, are overpaid, and retailers get no subsidies for taking containers back in store. The legislature is in charge of an ossified system of state payments to redemption centers scrambling to make a profit off the scrap in a volatile world market.

In every state with a bottle deposit program, except California and Hawaii, the beverage industry owns and markets the scrap. This nimbler approach gives the industry a bigger incentive to efficiently run a redemption system producing clean, marketable material for sale to recyclers.

Blueprint For California Bottle Deposit Reform

In other countries and states with the most successful programs, the beverage industry is responsible for the end of life of containers. In California, the best way to reform an overly prescriptive system that underpays redemption centers and overpays waste haulers is to reverse the current roles of government and industry—shifting administration of the program from CalRecycle to an industry consortium composed of beverage makers, distributors and retailers.¹⁹

The consortium would arrange for marketing and the sale of collected materials and should give contracting preference to existing high-volume recyclers to achieve redemption targets. The consortium would be financially accountable for meeting the targets, but should be required to utilize, to the extent possible, existing recyclers that have proven to be effective to accomplish their goals. It would be responsible for financing and managing the beverage container redemption and recycling system. That would include creating a transportation system for pickup and delivery of empty containers and fair payment to participants in the system. The consortium could also encourage more recycled content in beverage containers by charging higher fees to industry for the sales of beverages in unrecyclable containers.

The legislature would designate a redemption and convenience target—for example that all beverage retailers in the state redeem containers on-site. It would specify CalRecycle's

responsibilities to audit, oversee, and enforce the new targets. In addition, the legislature could pre-empt any incentive for industry to restrict redemption access in order to maximize unredeemed deposits. Legislation could prescribe that deposit amounts will automatically rise when redemption rates fall below 90% for two years in a row, for example. Financial penalties could also be set for missing the target and could be increased if the redemption and recycling rate declines.

Putting industry in charge of the bottle deposit system would also drive adoption of efficient systems and advanced technologies such as the installation of banks of Reverse Vending Machines (RVMs) in stores or off-site. The machines can help block fraudulent returns of beverages purchased out of state by reading barcodes and dispense cash or store credit in return for containers fed into the machines. In short, a free market-driven system, created with the proper incentives and penalties, would make it as easy for consumers to return empties as it is to buy beverages from soda to juice and beer. Accessibility to redemption is critical to making a bottle deposit system work.

GERMANY

German consumers pay a high deposit to incentivize beverage container recycling. The deposits on “single use” bottles and cans are up to 28 cents. Consumers redeem deposits at supermarkets and other retailers where they bought them. The collection system is 80% automated via RVMs.²⁰ Retailers and the beverage industry bear the costs of the system and are allowed to keep any unclaimed deposits. The rate of redemption is 96% for aluminum cans and 98.5% for PET plastic.

The United States landfills 69% of all of its municipal solid waste compared to Europe, which landfills on average 38%. But in Germany, one of several countries to drastically reduce landfilling, there will be no active landfills as of 2020. In the 1970s, that country had 50,000 landfills. Today, less than 300 exist.²¹ German companies will not pick up unsorted garbage and consumers can be fined for improper sorting of recyclables.

NORWAY

Norwegians have a similar system. An industry consortium also runs the bottle recycling system. Consumers can return empties at 15,000 redemption locations with 95% automation. “We want to get to the point where people realize they are buying the product but just borrowing the packaging,” Kjell Olav Maldum, CEO of Infinitum, told *The Guardian*.²² Norway sets a high target for recycling and uses taxation to make sure that target is met. The closer industry gets, the less environmental tax it pays. The consortium has managed to avoid the tax for years by meeting or surpassing the target. Making the beverage industry responsible for bottle recycling, while setting and enforcing recycling targets, incentivizes the industry to create efficient systems that put consumer convenience front and center.

LITHUANIA

In Lithuania, retailers with RVMs are paid a higher fee for handling empties than retailers without them. Consumers are refunded their deposit through vouchers that can be redeemed as cash, credited towards their shopping bill or donated. Retailers find that RVMs boost revenue by bringing in additional foot traffic. One national supermarket chain installed approximately 200 RVMs and watched as business grew with customers using their deposits to buy new products. Laurynas Vilimas, Managing Director of the Lithuanian Retailers Association, said: "I can say with absolute confidence the deposit return scheme was the right thing to do."²³

Another advantage of the machines is that automation cuts down on the time it takes to redeem empties while collecting a stream of clean recyclables sorted automatically by the machines. Virtually all bottle deposit systems around the world, except for California and many Canadian provinces, have barcode-based recording systems that can identify whether containers qualify for redemption.²⁴

The key factors that make bottle deposit systems in other countries successful are the degree of consumer convenience offered, the education of consumers, and the deposit amount.

In Europe and states such as Oregon and Michigan, consumers can return empties to stores where they bought them. In Oregon consumers also have access to redemption centers. Deposits are higher and consumers are better educated on the deposit systems.

Beverage makers, distributors and retailers in California have fought tooth and nail against taking empties back in-store. They nixed that prospect when they lobbied on the decades-old state bottle deposit law though they have staff, warehouse space, truck fleets, and the capacity to deliver empties to processors. They have managed to restrict consumer access to bottle redemption. Yet, retailers in other states and countries are perfectly capable, indeed well-positioned, to team up with the beverage-making industry to create very convenient and cost-effective consumer return systems and increase their own grocery sales at the same time. In California, they may not welcome the shift, but they can certainly do it. What is lacking is the political will to reform the program to make them.

How We Got Here

In the 1990s, in response to new recycling laws, waste haulers introduced single-stream recycling as a way to protect their landfilling profits, not to increase recycling rates. “In order to stem the tide of recycling, Big Waste took action to protect its hauling and landfill market shares,” according to the Institute for Local Self-Reliance. “It introduced single-stream recycling in which all recyclables were put in a single cart and started gobbling up materials processing capacity.”²⁵

Consumers had commonly separated paper and cardboard from plastic, glass and metal containers. Instead, the industry led consumers to believe that everything in the single bin, or even in the trashcan, was being recycled when it wasn't. The waste industry started investing in facilities to sort garbage and grew its profits by cutting costs on labor and delivery time. They no longer had to empty more than one recycling bin or use trucks with multiple compartments.

*“Single-stream
recycling facilities are
like trying to
unscramble an egg.”*

“When we switched to single-stream, recycling became this sort of feel-good, ridiculous thing that eventually reached the point where recycling companies told people, ‘Well, if you're not sure, just throw it in the bin and someone else will take care of it,’” according to Justin Stockdale, regional director of the Pennsylvania Resource Council.²⁶ “Single-stream recycling facilities are like trying to unscramble an egg, which no one has so far figured out how to do. You can never get things 100 percent clean in a single-stream plant, and therein lies the root of the problem.”

The waste industry promoted the idea that any increase in contamination would be offset by the increased volumes of recycled materials if consumers did not need to sort them first. It hasn't worked out that way. Contamination rates can cancel out any benefit from collecting larger quantities of recyclable materials. A 2002 study in Minnesota compared five different methods of recycling collection in St. Paul and found single-stream recycling increased tonnage collected compared to multi-sort systems. But it decreased the tonnage leaving the sorting facility ready for recycling. Single-stream systems also cost more to operate because of the increased cost of the sorting technology and the lower quality of marketed recyclables.²⁷

“There is significant evidence that the resulting scrap material quality (and hence the revenue) is lower under single-stream collection than it is under a dual-stream system or under systems like container deposits, where materials are kept separate,” according to

CRI.²⁸ “There is particular concern that glass shards and PET [Polyethylene terephthalate] bottles can contaminate paper loads and wreak havoc in a paper mill, and that glass, plastic and aluminum containers cross-contaminate each other.”

Material Recovery Facilities use a combination of workers and technology to sort material and companies have to protect both. Unrecyclable plastic bags, for example, can wrap around equipment parts and wreak havoc. Workers have to be kept safe from dangerous items such as medical sharps and chemicals, and from glass or plastic shards that can become deadly projectiles when run through machinery. Manufacturers who buy processed material to make into new products are rejecting more offerings after finding that they have to divert larger amounts of substandard scrap. They have to pay to landfill what is unusable and then they have to buy clean substitutes, a losing proposition.

According to Aimee Lee from the nonprofit Recycle Across America, hand sorting by consumers “would save the billions of dollars currently spent to remove contaminants from the recycling stream.²⁹ There would be fewer plastic bags and other contaminants jamming the processing equipment. There would be significantly less wasted time and money spent while equipment is shut down for repairs, and far fewer injuries to the employees at recycling plants. If we eliminate confusion at the bin, these costly inefficiencies would be remedied, and the demand for the materials would be strong.”

Bottle deposit programs are an example of that hand-sorting. Glass processors report that 60% of glass coming from single-stream programs is usable for making into glass bottles or fiberglass, according to CRI.³⁰ Another 19% is glass fines—small bits—that can be used as road base or landfill cover, but another 21% is mixed with contaminated non-glass residue and must go straight to a landfill. In contrast, 90% of the glass that comes from dual-stream programs that divert it from other materials can become new containers or fiberglass. The other ten percent can be used for low-end applications. Bottle deposit programs deliver color-sorted glass, resulting in 98% being recycled into high-end applications.

The only industrial sector that benefits from single-stream recycling is waste hauling. Haulers hold lucrative waste and disposal contracts and municipal recycling contracts on top. Single-stream collection saves money because it cuts down on truck staffing, loading, and delivery time. Increasing contamination rates only help the bottom line by keeping waste streams that go to landfills or incinerators high. This business model raises prices an estimated 30% above normal competitive prices, according to some analysts.³¹

“When there is this type of conflict of interest at such an influential level in the recycling industry, it becomes clear why the simple issue of public confusion at the bin wasn’t resolved,” writes journalist David Bornstein. “Because when recycling is highly contaminated and too costly to process, then the landfills generate more revenues, the virgin material industries sell more virgin materials and there is a stronger appetite for

building incinerators that burn waste to create energy. As an analogy, imagine the groups responsible for promoting road safety in the U.S. also owning most of the auto body shops, hospitals and morgues.”³²

How Waste Haulers Help Themselves

According to CalRecycle, the state’s recycling regulator, in order for California to reach a statewide recycling rate for solid municipal waste of 75% by 2020, more than half of the solid waste currently disposed would need to be recycled, composted, or reduced at the source.³³ Overall recycling rates for solid waste have fallen in California from a peak of 50% in 2012 to 42% in 2017.³⁴ That still beats national average estimates of roughly 30%.³⁵ But Californians are generating more and more trash. Since 2012, trash disposal has increased per resident from 5.3 pounds to 6 pounds every day.³⁶ That amounts to the weight of a subcompact car per person per year.

The state’s beverage container recycling program, intended to separate empties from the overall waste stream, once surpassed the state’s 80% recycling goal for empty containers to reach 85%, but has officially fallen over the last several years to 75%. But the redemption rate for consumers is a mere 66% because operators of consumer curbside and recycling drop-off programs are also paid consumer deposits.³⁷ Beverage container recycling rates where containers are diverted from the overall waste stream beat that of the total solid waste stream by nearly twice, but they could be even higher if skewed financial incentives were readjusted.

Operators of curbside and drop-off programs in rural areas where curbside service is often not offered, benefit from the redemption of containers that consumers throw into the trash or single-stream bins, in addition to collecting millions of dollars in state subsidies that have not been proven to increase the quality of recyclable materials. CalRecycle funds “supplemental programs” that have never been assessed for their environmental or cost effectiveness. These include \$15 million annually in “supplemental payments” to curbside and drop-off programs, up to \$10 million for “quality incentive payments” directly to glass processors to improve the cleanliness of glass, and \$5 million in “market development payments” for plastic bottles.³⁸

These curbside operators take in 12% of the beverage containers in the recycling program, while shrinking numbers of recycling centers take in 88%, according to CRI’s analysis of CalRecycle data.³⁹

The operators running curbside pickup or drop-off programs are grossly overpaid by CalRecycle. In 2017, these operators collected \$170 million in consumer deposits and

payments to make up for materials worth less than the cost of recycling. In addition, the industry earned more than \$13 million from scrap sales. The cost of actually handling the containers was \$43 million, leading to a calculation by CRI of \$140 million in gross profits, or a profit of 326%.

CalRecycle pays operators this deposit, known as a California Redemption Value (CRV) of a nickel or a dime corresponding to container size based on tonnage of container materials collected. Curbside operators submit weight records to CalRecycle and the agency then calculates the value per pound based on statewide survey data.

CRI found that the current system of providing CRV based on weight of baled containers results in overpayments of \$10 million a year.⁴⁰ That is because contaminants present in those bales make them heavier, creating a perverse incentive for waste haulers to continue contaminating recyclables. In addition, operators are allowed to submit the results of their own surveys and also apply to CalRecycle for higher than standard refund rates likely totaling millions of dollars more in extra payments.

In 2017, curbside and drop-off operators got 17 times more in payments from CalRecycle for PET than the material would normally be worth, according to CRI. They got about nine times as much as it cost them to recycle aluminum cans, and three times as much as it cost them to recycle glass bottles. Meantime, the agency radically underpays redemption centers. CRI estimates that redemption centers were shorted by \$42.7 million between 2013 and 2016 by the state.⁴¹ As the value of aluminum has fallen, these centers that have only the risky scrap market to rely on to generate 80% of their revenue are closing in droves.⁴² As of January 2020, 1,205 redemption centers remained open statewide, according to CalRecycle. That is less than half the number that operated in 2013.

Uncollected deposit money is supposed to make the system work by providing consumers access to redemption so they can get back their nickels and dimes, not push the centers out of business while fattening waste hauler wallets.

No other state uses funds from its bottle deposit program to make millions of dollars in “supplemental payments” to operators of curbside and drop-off recycling programs just for existing. Only one other state in addition to California pays them for associated recycling costs plus allows them to collect consumer deposit money on top. California is unique for paying waste haulers twice for curbside recycling—via lucrative municipal

*“California is
unique for
paying waste
haulers twice
for curbside
recycling”*

contracts and via outsized state payments. Whether more waste goes to landfills or

incinerators does not matter as that revenue goes into their pockets too.

Waste management companies, which generate less than ten percent of their revenue from recycling, are overcompensated by CalRecycle while generating far more lucrative revenues and impressive profits from their own hauling, landfilling and incineration services. Waste Management reported a record-setting year with total national revenues of \$15 billion and operating profits of more than \$4 billion for 2018.⁴³

Increased consolidation in the waste hauling business has put four garbage haulers in charge of at least 50% of the national market for waste hauling, and 75% of the permitted landfill capacity in major metropolitan areas, according to the Institute for Local Self-Reliance.⁴⁴ They also own and operate 60% the recovery facilities in the United States.⁴⁵ Those four companies are Waste Management, Republic Services, Waste Connections and Advanced Disposal.

Three of them—Waste Management, Republic Services, and Waste Connections—operate in California. Those three companies plus others operating in the state—Recology, Athens Services, and CR&R Waste and Recycling Services—have contributed \$2.4 million from 2017 to 2019 to local and state political campaigns, committees, measures and associations, according to filings with the California Secretary of State.

Between 2017 and 2019, Waste Management, Recology and its PAC, Republic Services, Athens Services and others contributed \$791,000 to individual state lawmakers alone.

Waste Haulers/Recyclers	Total Contributed to Legislature 2017-2019
Recology PAC	\$284,150.00
Recology	\$278,050.00
Republic Services	\$102,449.99
Athens Services	\$48,200.00
Waste Management	\$42,500.00
CR&R	\$17,880.00
Waste Connections	\$17,800.00
TOTAL	\$791,029.99

Letting these companies control recycling is a conflict of interest. “The key takeaway is that a critical activity such as recycling in U.S. cities should not be entrusted to consolidated companies whose main business is landfilling and incinerating garbage,” according to the Institute for Self-Reliance.⁴⁶ “This is an obvious conflict of interest that has been the focus of attention in the grassroots recycling movement for quite a while. They fight to keep waste volumes large by claiming that the public is to blame for contamination of recyclables without ever questioning whether single-stream recycling might be the culprit—and for good reason. Any threat to market share of waste volumes is a direct threat to their bottom line and their value to stockholders, which is necessary to obtain capital for further consolidation of the industry.”

Waste haulers have long offered recycling services to help win and keep lucrative municipal garbage contracts. But trash companies’ main business is landfilling and incinerating garbage. In some California communities, such as South Pasadena, all recyclables simply go into the trash and are sorted at “dirty” recovery facilities where contamination rates are higher than in single-stream systems. StopWaste.org, in Alameda County, calculated that the average recovery rate for such facilities in California is 19% compared to 85% at the best recovery facility.⁴⁷ Though such mixed waste facilities today make up less than five percent of all recovery facilities, some California towns still use the method.

Today, the virtual closing of China’s market because of the U.S.’s high rates of scrap contamination has these giant haulers jacking rates for their recycling services, but it is unclear how much of recyclables that they collect go straight to landfills or incinerators instead. As *The New York Times* writes, “Some municipal leaders are growing wary of

companies that control virtually every aspect of the waste and recycling system. ‘Are these rates truly high, or is it about benefiting their corporate interest?’ asked Mike Ryan, the mayor of Sunrise, Fla. ‘We can’t afford to have inspectors constantly looking over their shoulders.’”

A backlash in some U.S. cities against waste hauler fee hikes and their refusal to take certain materials from plastics to glass has led to cutting out waste haulers altogether. In Houston, Waste Management’s decision to stop taking glass infuriated residents.⁴⁸ The public pressure led to a partnership with Strategic Materials, the biggest glass recycler in North America, which had partly relied on Houston’s recycled glass stream. The company and the city set up ten convenient glass drop-off locations throughout Houston. If Houston can do that, so can cities in California.

How The Beverage Industry Helps Itself

In California, producers and sellers of products packaged in glass, metal, or plastic containers are, so far, not made to take any responsibility for the end of life of containers. Nowhere is this clearer than in California’s beverage container recycling program.

The industry that produces, distributes and retails beverages simply does not want to spend any money helping to recycle the waste it creates. The American Beverage Association, representing soda brands in the US from Coke to PepsiCo, plows money into initiatives promoting single-stream recycling that keeps them off the financial hook.⁴⁹

Powerful lobbies representing beverage makers, distributors, and retailers such as Pepsi and Coke, Walmart, Vons, Albertsons, Safeway, Ralphs and Rite Aid successfully resisted any responsibility for the end of life of containers by fighting off a bottle bill in California until 1986 when they wound up shaping key elements of it.⁵⁰ Retailers and distributors successfully lobbied for a network of redemption centers with the legislation absolving them of taking containers back in-store unless centers in their parking lots or nearby closed. Now that centers are closing in droves, many retailers are refusing to be the recyclers of last resort.

In addition, producers and distributors of wine and distilled spirits successfully lobbied to be excluded from the program. Iowa's program includes wine and liquor as does Maine's. Vermont's program includes liquor. California's beverage container recycling program covers beer, malt, coolers containing wine and distilled spirits, and most non-alcoholic beverages.

Expanding beverage containers in California to include wine and distilled spirits would generate tens of millions of dollars more for the recycling program each year. California accounts for nearly 90% of the U.S.'s entire wine production and is among the top ten wine-consuming states.⁵¹ Beverage industry market research purchased and analyzed by CRI shows that 2017 wine and spirits sales in California totaled 1.2 billion containers, 97% of which were bottles. Depending on the size, containers could each carry a deposit of a nickel or a dime.⁵² Based on 2017 beverage market research, CRI estimates that the state could have raised \$104 million in deposits from wine and spirits sales that year.

Far from advocating for an expansion of covered beverages, more beverage industry responsibility, new rules and recycling targets, CalRecycle is abetting retailers by not widely enforcing the current bottle deposit law or cracking down on violations. Instead, the agency granted more than 1,200 exemptions from retailer recycling responsibilities in the last three decades, according to agency data analyzed by CRI and Consumer Watchdog reports.

Little more than one third of the states 4,000 designated consumer "convenience zones" have a redemption center and another third have exemptions from the program.⁵³ In the rest of those zones lacking redemption centers, retailers are supposed to provide on-site redemption or pay state fees to get out of the responsibility. The vast majority of stores, according to CalRecycle, elect to take empties back in store. But in fact many don't.

Currently, extrapolating from a Consumer Watchdog audit of 50 Los Angeles-area grocery, convenience and drug stores required by the state to refund consumer bottle deposits, up to two thirds of retailers responsible for redemption where no centers exist may be refusing to take bottles back in store. If caught by CalRecycle, the penalty is between \$100 and \$1,000, depending on whether it is a repeat offense, and chances are retailers will never be inspected. 3,996 stores have signed up with CalRecycle to redeem empties in zones with no centers.⁵⁴ After many years, CalRecycle recently made this list public—unlike a shrinking list of redemption centers that consumers have long been able to search online. Consumer Watchdog requested this list to use it for its own audit.

Consumer Watchdog’s audit found that half of the remaining one-third of stores that did redeem made the process difficult, requiring consumer persistence and knowledge of the bottle law and consumer rights. In addition, only 30% of the stores posted required recycling signs explaining that the stores refund deposits. Few managers at stores that took empties were generally knowledgeable and most clerks were clueless until prompted. More than once, a manager had to be summoned in order to override a cashier’s rejection of containers, suggesting that corporate policy at some chains is not to train clerks and cashiers on the law.

“It’s Californians who foot the bill for the bottle deposit program.”

In the United States, major beverage companies such as Pepsi have spent millions of dollars to defeat bottle bills by claiming that container recycling programs are inconvenient and lead to higher beverage prices.⁵⁵ They argue it’s more convenient for consumers to throw empties into a single bin than take them back where they came from.⁵⁶

In fact, deposit systems that cost more to create up front are far more cost-effective in boosting recycling rates than curbside and other recycling programs, resulting in more bang for the buck.⁵⁷ Claims by the industry that deposits are a “tax” are untrue because deposits are refundable. Consumers can easily take bottles and cans back to the store as part of their shopping routine and more are likely to do so if deposits are high enough and access to redemption is ubiquitous.

The beverage industry’s money buys it protection. Last year, the American Beverage Association that represents Pepsi, Coke, Dr. Pepper, Red Bull and other brands, spent \$914,000 on lobbying compared to \$380,000 the year before, according to the *Los Angeles Times*.⁵⁸

Major beverage retailers, including Albertsons, Safeway, Vons Pavilions, Ralphs, Walmart, 7-Eleven, Target, Rite Aid, CVS Caremark and Walgreen's plus grocers' PACs contributed more than \$5 million to political campaigns, committees and ballot measures between 2015 and 2019, according to major donor reports filed with the California Secretary of State's Office. Between 2017 and 2019, these retailers contributed \$934,000 to individual lawmakers alone, according to Secretary of State filings.

Retailer	Total Contributed to Legislature 2017-2019
CVS	\$366,300.00
Walgreens	\$208,000.00
Albertsons Safeway	\$85,500.00
Walmart Sams Club	\$82,500.00
7-Eleven	\$71,600.00
Target	\$64,500.00
Rite Aid	\$38,000.00
Northgate Gonzalez	\$17,400.00
TOTAL	\$933,800.00

Major beverage producers Anheuser-Busch, Pepsico, Coca-Cola, E&J Gallo Winery, and Southern Glazer's Wine & Spirits gave more than \$2 million to individual lawmakers in the same period.

Producers	Total Contributed to Legislature 2017-2019
ANHEUSER-BUSCH COMPANIES	\$804,047.77
SOUTHERN GLAZER'S WINE & SPIRITS	\$628,000.00
Pepsico	\$282,395.13
E & J GALLO WINERY	\$153,364.00
Coca-Cola	\$164,523.00
TOTAL	\$2,032,329.90

PACS and associations representing soda makers, beverage retailers and waste management companies gave state lawmakers contributions totaling \$1.2 million.

PACS & Groups	Total Contributed to Legislature 2017-2019
CA Beer and Bev Distributors	\$427,500.00
Wine Institute PAC	\$280,933.53
CA REFUSE RECYCLING COUNCIL PAC	\$231,250.00
American Beverage Assoc	\$96,550.00
CALIFORNIA GROCERS ASSOC PAC	\$95,600.00
CALRETAILERS PAC	\$57,600.00
LA COUNTY WASTE MANAGEMENT ASSOC PAC	\$46,250.00
SOLID WASTE ASSOC OF ORANGE COUNTY PAC	\$24,000.00
TOTAL	\$1,259,683.53

Just this year alone, five bills targeting sugary drinks with taxes, warning labels, or size limits were rejected or shelved.⁵⁹ In addition, ambitious legislation to require an increase in the amount of recycled content in plastic bottles covered under the deposit system passed. But the legislation was vetoed due to last-minute amendments to undermine enforcement pushed by the beverage industry.⁶⁰

In Europe, multinationals comply with laws on bottle recycling because they are given no choice. Nor does the EU give them a choice on packaging improvements. For example, despite objections from Coca-Cola, Danone, Nestle and PepsiCo, the EU has passed new requirements to connect plastic caps to bottles to reduce the amount of caps littering beaches.⁶¹ The beverage industry killed off a similar bill in California in 2018.

The industry's clout in California has meant that beverage distributors and retailers assume less than two percent of the cost of the beverage recycling program, while collecting roughly the same amount back from the state in "administrative fees," according to CalRecycle data analyzed by CRI. It's Californians who foot the bill for the bottle deposit program.

How CalRecycle Helps Itself

Today, recycling regulator CalRecycle appears to be amenable to the beverage industry's wish to take even *less* responsibility for beverage container recycling. Instead, the agency appears to favor growing profits for waste haulers by increasing the volume of bottles and cans thrown into curbside recycling bins. CalRecycle spent nearly \$1 million on a

Berkeley study to justify easing the few requirements on the retail beverage industry that currently exist.⁶²

In California, the state pays extra “handling” fees to redemption centers that are the first to locate within a half-mile radius of a major supermarket in state-designated consumer convenience zones. But redemption centers located in store parking lots generally have higher expenses. In addition, redemption centers in rural locations also have higher expenses such as getting collected materials to market.

The Berkeley study argues that closure of from one third to all handling centers across California “would not have a major impact on the welfare of California residents except perhaps for rural residents that may live a significant distance away from any other recycling centers.” The study instead champions curbside recycling as “the most convenient way to recycle: it has no lines, travel time or open hours.”

The study also recommends against doubling California’s deposit because that would incentivize consumers to return bottles for refunds. That would mean less deposit revenue for curbside haulers and would leave CalRecycle with less unredeemed deposit money to dispense.

In fact, this conclusion is incorrect. If California’s deposit was doubled, that would double the value of each unclaimed deposit. Though more consumers would be motivated to redeem deposits, roughly the same amount of money would be left uncollected. This would leave more or less the same amount of money unclaimed to run the program. If the amount of money paid to curbside and drop-off recycling programs that siphon off consumer deposits was also reduced, the state could wind up with more money overall to put into redemption centers and other services.

The Berkeley study’s authors who push curbside recycling as a better solution for bottles and cans also appear unaware of the qualitative difference between curbside recycling and the separation of bottles and cans from all other recyclables. The separation of these materials from the rest of what goes into single recycling bins results in lower contamination rates. Nor do they explore the higher landfilling and incineration rates of bottles and cans from single-stream systems.

The study on “convenient” beverage container recycling in California never engages the issue of whether retail stores should have to take empties back in-store as a critical way to increase convenience. It does recommend “easing” convenience zone requirements, which would result in fewer stores having to take empties back. It recommends no action to save smaller centers.

CalRecycle wanting to cut the number of redemption centers that form the backbone of the state’s once-vaunted bottle recycling program, while allowing even more stores to get

out of taking empties back, is an example of an agency prioritizing bureaucratic and corporate interests over consumer interests.

Producer Responsibility

As *The Mercury News* opined in an editorial, “It’s time to shift the cost and recycling burden. The nine other states with redeemable deposit programs haven’t seen the same decline in recycling rates as California, according to a 2017 report from the state Legislative Analyst’s Office. That’s in part because beverage distributors play a more significant role in those states and are responsible for most of the recycling cost.”

Other programs under CalRecycle’s purview that have shifted that responsibility to industry could be applicable to the container recycling program. For example, the state did shift the responsibility for recycling paint and mattresses to industry in laws passed in 2010 and 2013. These industry-led statewide programs, overseen by CalRecycle, manage the recycling and disposal of these products.

Paintcare, steward of the paint program, reported in fiscal year 2017-18 that 98.5% of all Californians have access to a drop off site for unwanted paint within 15 miles of where they live.⁶³ Paintcare completed 505 pickups of large volumes of 200 gallons of paint or more and processed enough gallons to paint the walls of nearly 3.5 million rooms. Out of all paint sold each year, ten percent is left over. They estimated they processed 54% of it. Similar progress was reported by the Mattress Recycling Council. They collected nearly 1.3 million mattresses and foundations in 2017, surpassing the number of units collected in 2016 by 35%.⁶⁴ The weight of the material recycled also increased by 35% in 2017 to nearly 40 million pounds.

Both are examples of “Extended Producer Responsibility” that places a shared responsibility for end-of-life product management on producers and all entities involved in the product chain, instead of onto the general public only. This encourages product design changes that minimize negative impacts on human health and the environment at every stage of the product’s lifecycle, according to CalRecycle.⁶⁵

The next logical step—extending producer responsibility to the beverage container recycling program—is not a new concept. In fact, CalRecycle commissioned a study on how to restructure the deposit system in 2009.⁶⁶ The report, by the Sacramento-based R3 consulting group, and CM Consulting of Ontario, Canada compared bottle deposit programs in British Columbia, Ontario, and Germany to California’s.

The report found merit in such programs, all of which are based on the producer responsibility principle. “There seems to be a consensus evolving in North America that

good EPR [Extended Producer Responsibility] programs are results-based rather than highly prescriptive. In other words, the government’s role is to set performance standards in the public interest (with stakeholder input), and then step aside and let producers design and operate effective programs to recover their products. Then, government’s role is to ensure transparency and accountability for outcomes.”

The programs were driving successful beverage container packaging redesign, recycling and program innovation in Canada and Europe. The report and stakeholder comments were never published on CalRecycle’s website and the findings and recommendations appear to have been all but forgotten. Meanwhile, those programs reviewed have redemption rates of 80% to 95%, far surpassing California’s 66% redemption rate.

California And Other States

As the R3 report pointed out, the three most crucial aspects of successful bottle deposit programs are the deposit amount, consumer education, and wide access to redemption. Higher redemption rates are directly linked to consumer convenience. Yet, California’s system is the most inconvenient in the world.

Latest Available Redemption Rates of 10 State Deposit Programs (2017-18)

In California—unlike eight out of nine other states with bottle deposit programs—beverage retailers from grocery chains to big box, convenience and drugstore chains, are not required to take back empties alongside redemption centers.⁶⁷ The law obligated them to be recyclers of last resort if redemption centers failed to materialize or closed. Now that redemption centers are in economic crisis, the majority of retailers are refusing to fulfill those responsibilities.⁶⁸

The largest chain of redemption centers in California, rePlanet, announced in August the closure of the last of its 284 centers throughout the state. That now leaves the state with 1,205 redemption centers, less than half the number that the state had five years ago. Now, each redemption center has to serve an average of more than 32,000 people, according to CRI. In the ten worst hit counties, eight of them in the Bay Area, each center serves an average of nearly 130,000 people, according to CRI's analysis of CalRecycle data.⁶⁹

The state regulator, CalRecycle, did not publish a list of stores providing redemption services on their website for consumers until August of 2019 and spent no money last year educating the public about this option. Many stores do not even educate their own employees on the bottle law. Consumers are clueless about their right to redeem at retail stores when no redemption center exists within a half mile, so the number of empties thrown away or littered is growing.

Meantime, redemption centers are underpaid by the state while being left to generate most of their revenue from scrap sales on rocky domestic and world markets. In 2019, CRI's analysis of CalRecycle data concluded that some 400 more centers were on track to close without sufficient long-term funding. Redemption center operator rePlanet closed 284 locations within a few months of that prediction. If the program is not fundamentally reformed in the next 24 months, and supermarkets are not forced to live up to their redemption obligations, there will not be much of a bottle recycling program left to administer.

Returning empties right to the store where you do your shopping dramatically increases consumer convenience.

Seven other states and the vast majority of programs worldwide mandate redemption at *both* stores and redemption centers. In Michigan, the eighth state, consumers have only one place to redeem—retail stores that sell beverages.⁷⁰ The lack of consumer convenience created by drastic restrictions on access to deposit refunds hobbles

California. Normally seen as the leader in any progressive pack, California is now in fifth place when it comes to its bottle redemption rates.

Oregon and Michigan

Oregon and Michigan are among the ten states that have bottle deposit programs with the highest redemption rates. Oregon's hit 90% during 2018, settling at 81% for the year. Michigan's is 89% for 2018. The amount of the deposit matters in boosting redemption rates.⁷¹ So redemption rates in Oregon and Michigan where deposits are ten cents dramatically outpace rates in states such as California with nickel deposits. Tough recycling laws work hand-in-hand with deposit amounts to keep containers from becoming pollution. Michigan, for example, prohibits beverage containers from going into landfills—and forces retailers to redeem at least up to \$25 a day in bottle deposits per consumer.⁷²

All bottle deposit programs rely on unclaimed deposits to help finance the system—whether run by state government or industry. But dependency on unclaimed deposits can encourage whoever runs the system to ensure that more deposits remain uncollected for their benefit. One way to counteract falling redemption rates is to increase deposits when redemption rates fall below a set target. That is what happened in Oregon.⁷³

Nearly every state program has seen declining redemption rates over the last several years, but Oregon is the one state that has experienced dramatic increases. Thanks to a state law passed in 2011 that required the deposit to jump to ten cents if return rates fell below 80% for two years in a row, redemption rates are skyrocketing there.⁷⁴ In 2015 and 2016, rates plummeted well below that goal. In 2017, the deposit was doubled as the law prescribed. In 2018, the redemption rate hit 90% and then settled for the year at 81%. The industry consortium that runs the deposit system, the Oregon Beverage Recycling Cooperative, reports that in the first quarter of 2019, redemption rates exceeded 90%.

Today, consumers can return empties in-store or at redemption centers.⁷⁵ Redemption sites, called BottleDrop Centers, provide consumers with RVMs where they can redeem up to 350 bottles and cans per person per day and get cash automatically from kiosks, or they can have a center employee sort up to 50 bottles and cans per person and issue refunds. Consumers can also set up online accounts, get labels and green bags and drop them off anytime, 24 hours a day, at redemption centers or participating stores for credit. Big retailers with no redemption center nearby must accept up to 144 containers per person per day.

The program is run by a member-owned and run cooperative corporation called the Oregon Beverage Recycling Cooperative (OBRC). The entire recycling process is handled

by the beverage industry at no cost to the taxpayer, according to OBRC.⁷⁶ The cooperative manages the deposit flow, reimburses grocery retailers for refunds paid to the public (grocery stores are charged the deposit when distributors sell them beverages wholesale), and arranges pickup and processing of returned beverage containers across the state, as well as operating redemption centers.

The OBRC has worked to modernize its BottleDrop redemption system not just to help consumers with access to redemption services, but also to help reduce burdens on retailers to accept empties and then deliver them for processing.⁷⁷ For example, in 2011 Oregon had only two redemption centers. That year the state approved expansion of that pilot project. Today, the OBRC offers 25 centers with 280 RVMs.⁷⁸ Participating retail stores total 2,230 and offer access to another 423. Consumers can open redemption accounts online. They can choose between hand-counted or automated returns or can drop off bags of containers for automatic credit. They can obtain refunds via credit and additional discounts at participating stores, cash, or donate the deposits. The average amount refunded to account holders in 2018 was \$102, according to the cooperative.

After tractor trailers pick up the beverage containers, they are counted, sorted, crushed, and baled for delivery to one of eight recycling facilities around the state. More than 138 million pounds of beverage containers are diverted from landfills every year that way, according to the OBRC. The separation of glass, plastic and aluminum from the rest of the recycling stream means it is cleaner and therefore easier to sell the material domestically.

Successful Recycling Programs In The Rest Of The World

Germany

European countries such as Germany and Norway are light years ahead of California in terms of their bottle deposit systems achieving high redemption rates. They do this by putting the responsibility of the end-of-life management of containers and other packaging onto industry.

Many European countries with bottle deposit programs mandate that companies meet high standards of packaging recyclability to qualify for Green Dot status.⁷⁹ The Green Dot trademark, a German invention, is the symbol for a European network handling the recycling of consumer goods packaging. Product makers pay a license fee, which funds the system. Fees and covered materials vary by country. This system incentivizes industry to cut down on packaging in order to decrease their licensing fees.

In Germany, manufacturers pay a licensing fee to an industry consortium in exchange for permission to add a Green Dot logo to their labels. The logo indicates a high degree of recyclability and that this packaging should be sorted into separate yellow bags or bins at residences, outside supermarkets, or in public parks for pick up.⁸⁰

Paper, Plastic, Waste, Glass, Metal

The licensing fee is calculated on the basis of packaging weight, complexity, material type used, and volumes of the product produced. This has led to the invention of smaller and lighter weight, more easily recyclable packaging, which leads to lower license fees. The system has been adopted by other European countries. This year, the law was reformed and broadened to require any company selling into the German market, including online retailers, to comply with German packaging laws.⁸¹ As of 2021, new EU rules kick in banning single-use plastics such as food packaging, straws and coffee cups altogether.

In Germany, the beverage industry runs the country's bottle deposit system and brings the scrap to market. Consumers pay a comparatively higher deposit, up to 28 cents, to incentivize container recycling and raise redemption rates. Consumers redeem deposits at supermarkets or other retailers. The collection system is 80% automated via RVMs and the rest of the containers are redeemed manually.⁸² Consumers can also get refunds from beverage delivery companies via scheduled home pickups. Retailers and the beverage industry bear the costs of the system and are allowed to keep any unclaimed deposits. The rate of redemption is 96% for aluminum cans and 98.5% for PET plastic.

Moreover, the bottle deposit system is part of a larger national policy on the recycling of all packaging. The country follows a "polluter pays" principle, enshrined in its 1991 packaging law, meaning the producer, not the consumer, must pay for reuse or recycling of packaging. German industry set up a "dual system" of waste collection. Household packaging is separated and picked up in parallel to trash collection. This industry-funded system is run by Duales System Deutschland GmbH, or DSD, that serves the world's single biggest garbage recycling system where 80 million people are required to sort their waste into separate bins.⁸³

Germans recycle much more than Americans largely because they are offered convenience and are extensively informed by waste haulers about how to correctly sort waste and recyclables via color-coded bins and bags.⁸⁴ In addition, clear labelling designates what goes into the bins. Consumers have access to seven different bins, including green dot packaging, paper, compost, general trash, and clear, brown and green glass separated by color. An incorrectly sorted bin will not be collected, furthering consumer awareness and education. The incentive is high to separate paper, plastic and glass from household trash because recyclables get picked up every two weeks but trash only once a month. The price paid for trash pickup depends on how much trash a consumer generates, whereas pickup of recyclables is free.

Norway

Norway's bottle deposit system mirrors Germany's. The system is run by Infinitum AS, a consortium of major food and drink makers and major supermarket chains that reimburses retailers the refunds. Deposits are up to 30 cents on single-use bottles and multiple color-coded bins. Conveniently-located RVMs are provided. Return rates are high—95.4% of PET bottles and 96.6% of all drink cans.⁸⁵

All stores selling beverages have to collect empties and refund deposits. Bigger stores use RVMs that can scan barcodes, crush and pack the bottles for collection as well as issue refunds. Small stores generally collect empties over the counter. Every store gets a fee per bottle or can. Retailers report that the service increases foot traffic in the store. Norwegians can return empties at 15,000 redemption locations with 95% automation.⁸⁶

About 45% of the revenue needed to run the system comes from the five percent of unredeemed deposits. Infinitum also owns and sells the recycled scrap for revenue and collects administrative fees.

According to Infinitum's chief executive, 97% of all plastic bottles in Norway are recycled, 92% are so clean that they can be turned back into beverage containers. Some of the material has already been recycled 50 times and less than one percent of the material ends up in the environment. "We want to get to the point where people realize they are buying the product but just borrowing the packaging," Kjell Olav Maldum, CEO of Infinitum, told *The Guardian*.

Producers and importers of beverages packaged in cans or non-refillable PET bottles register their products in the deposit system. The deposit they collect is paid to Infinitum to label the bottles and cans with the deposit symbol. Norway also puts an environmental tax on all producers of plastic bottles. The higher the national recycling rate, the less tax companies have to pay. If they collectively manage to recycle more than 95% of cans and recyclable PET plastic containers, which they have done every year since 2011—they are exempted from paying the tax altogether.

Lithuania

The Baltic country of Lithuania is the one of latest to pick up on Norway and Germany's example of a successful bottle deposit system. It uses the same national deposit model and has seen widespread success since the system's launch in 2016 when the first RVMs were introduced at retail shops.

An association of Lithuanian brewers, trade enterprises and mineral water manufacturers runs the system. Užstato Sistemos Administratorius (USAD) handles the deposit system, reporting, logistics, marketing collected materials and educating stakeholders and consumers. Its sources of income include unredeemed deposits, revenue from the sale of collected materials and administration fees paid by beverage producers. Eligible stores get a free RVM. USAD pays a handling fee per collected container to the store, to cover RVM-related costs such as extra space, setup, and maintenance. The provider of the machines recoups the investment via a fee USAD pays for each container collected through an RVM.

Retail shops with RVMs are paid a higher handling fee than shops without them. Consumers are refunded their deposit as vouchers that can be redeemed in-store as cash or credit towards their shopping bill. That brings in additional foot traffic. One national supermarket chain installed approximately 200 RVMs and watched as business grew with

customers using their deposits to buy new products. Laurynas Vilimas, Managing Director of the Lithuanian Retailers Association, said: “I can say with absolute confidence the deposit return scheme was the right thing to do.”

The scheme has been widely labeled as a success due to the surprisingly rapid results, with 1.2 billion units of plastic beverage containers returned in just two years.⁸⁷ There are now over 1,000 machines in large retail chains across the country and more than 1,800 small shops are also accepting plastic containers brought in by customers. The deposit is a comparatively low 10 Euro cents, but in two years the recycling rate for PET bottles went from 34% before the system began to 91.9% by the end of the second year.⁸⁸

The advantage of RVMs is that it cuts down on the time it takes consumers to redeem empties while industry collects a stream of clean recyclables. The technology also can read barcodes on containers to determine the manufacturer and the product. Virtually all bottle deposit systems around the world, except for California and many Canadian provinces, have barcode-based recording systems.⁸⁹ If beverage distributors would get actively involved in the barcoding by adding code on their containers to make sure RVMs could not read containers brought in from out of state, that could help in cutting down on bottle recycling fraud. In the U.S., containers are not labelled state-by-state and thus not traceable when large quantities are brought into California for illegal redemption.

Conclusion & Recommendations

Single-stream recycling has proven itself a bust—the method contaminates the stream of potentially high-grade recyclables that could be turned into higher value products. The method has served to hurt the U.S. market for recyclable scrap at home and abroad. To improve the quantity of clean recyclable material, California needs to move away from rewarding waste haulers for their recycling services built on the myth of quality recycling tied to a single bin and towards the beverage industry where the responsibility for recycling should really reside.

The factors that make bottle deposit systems in other countries successful are the degree of consumer convenience offered, the education of consumers, and the amount of deposits. In Europe and states such as Oregon and Michigan, consumers can return empties in stores and have access to RVMs, often placed by grocery chains in specially-designated rooms. Deposits are higher, incentivizing redemption, and consumers are educated on the deposit systems.

In California, this is not the case. Consumer convenience is rare and so is an automated way to return empties. California retailers found ways to eliminate RVMs from stores years ago by refusing to pay to have them serviced or to staff them with employees that would empty them, according to industry sources. Many beverage retailers that claim to CalRecycle that they take back empties where no redemption centers can be found, really aren't. They are betting that they will not be caught and, if they are, the penalty will amount to essentially cab fare.

Economically, recycling also beats landfilling or incineration in creating new jobs, sustaining ten times more jobs on a per-ton basis of materials, according to the Institute for Local Self-Reliance.⁹⁰

Specifically, container deposit systems create 11 to 38 times more jobs than a curbside recycling system for beverage containers, according to a study produced for CRI.⁹¹ Ton for ton, deposit systems create at least five times more jobs in container collection, sorting and transport than in garbage collecting, hauling, and landfilling. The reason deposit systems create the most jobs among the leading systems for container recovery is that they recover more of the target material.

To make a serious dent in reducing the contamination of recyclable materials, such as empty beverage containers, California must revert to the way recycling was handled before—materials must be separated into two or more streams.

One place to start major reform is the state's beverage container recycling program. The fact that California already separates out recyclable beverage containers from the larger waste stream is a plus and something to refine as the overall state of recycling in California is improved. To that end, Consumer Watchdog recommends the following to the Administration and lawmakers:

- **Mandate that all major grocery store, big box, convenience and drugstore chains take back empty beverage containers along with redemption centers.** Consider paying stores handling fees to handle empties, install and service Reverse Vending Machines.
- **Require CalRecycle to enforce the existing bottle deposit law by levying meaningful fines on retail stores for each day, including retroactively, that they shirk their current recycling responsibilities.** A recent Consumer Watchdog audit found that two thirds of stores in the Los Angeles area obligated to take back bottles refused to do so.
- **Expand the beverages included under the deposit program to wine and distilled spirits.** This will increase the amount of money generated for the beverage container recycling program by roughly \$100 million annually and provide funds to support redemption.
- **Once convenient access is ensured, if necessary double consumer deposits to incentivize consumers to recycle.** California charges a nickel deposit on specific beverage containers under 24 ounces and a dime on containers of 24 ounces and up. Doubling deposits while increasing convenient return options would boost redemption rates dramatically.
- **Require CalRecycle to educate consumers about their in-store return options and the new availability on their website of a searchable list of stores redeeming deposits.** CalRecycle only recently posted this list, though a searchable list of redemption centers has long been available.
- **Eliminate unjustified subsidies to waste haulers while paying redemption centers a flat fee for service that provides them a reasonable return.** Currently, redemption centers take all of the market risk to generate revenue from what they collect without additional revenue streams that waste haulers generate.
- **Call for reform of the bottle law to shift responsibility for the recycling of containers to the beverage industry with the legislature setting a 90% redemption target and CalRecycle enforcing the law.** In

more successful programs, the beverage industry is in a better position to finance and efficiently run bottle deposit systems at a lower cost.

- **In addition to a redemption target of 90%, add new financial penalties on the beverage industry if the target is missed.** A similar model has worked to spur industry in Norway to produce very high-quality recyclable material to avoid penalties.

Citations

¹ This estimate of CalRecycle funds available for recycling of beverage containers is from its latest quarterly report, “Quarterly Report on the Status of the Beverage Container Recycling Fund, First Quarter, FY 2018-2019.” CalRecycle is behind on its quarterly reports, so this estimate does not take into account changing circumstances in real time. For example, as redemption centers close, recycling rates are likely to keep dropping. Every point drop in recycling rates that once stood at 85 percent adds approximately another \$15 million to the available funds, according to the Container Recycling Institute.

⁶⁷ To compare California to other U.S. bottle deposit systems and to systems in other countries, see the Bottle Bill Resource Guide at: <http://www.bottlebill.org>

⁶⁸ About 3,800 retail stores are signed up with CalRecycle to take back empties. But extrapolating from a survey by Consumer of 50 LA-area stores, up to two thirds may be refusing to take back empties. This represents \$91 million in lost fees annually that CalRecycle could collect as stores have a choice to sign up to take back or to pay a daily fee. Only a few hundred stores opt to pay that fee, which amounts to \$36,500 annually per store. See Consumer Watchdog’s survey here: <https://www.consumerwatchdog.org/energy/consumer-watchdog-report-shows-66-grocery-stores-surveyed-refused-recycle>
